

E-Commerce Website Project Prompt

I want you to act as a Senior Full-Stack Software Engineer and Software Architect.

Help me build a professional e-commerce platform similar to Jumia, but starting as a **single-vendor online store** with the ability to expand into a multi-vendor marketplace in the future.

Project Goal

Build a modern, scalable, secure, and responsive e-commerce website.

Tech Stack

- Frontend: React.js + Tailwind CSS
- Backend: Node.js + Express.js
- Database: MySQL
- Authentication: JWT
- Image Storage: Cloudinary
- Payment Gateway: Paystack or Flutterwave (Mobile Money and Card Payments)
- Version Control: Git

User Roles

1. Customer
2. Administrator

Customer Features

- Register and Login
- Browse products
- Search products
- Product categories
- Product details page
- Shopping cart
- Checkout
- Order history
- Wishlist
- Customer profile
- Track order status

Admin Features

- Secure admin login
- Dashboard
- Add/Edit/Delete products
- Upload multiple product images

- Manage categories
- Manage inventory
- View all orders
- Update order status
- View customers
- Sales reports

Delivery Rules

- Pay on Delivery is available only within Kumasi.
- Customers outside Kumasi must pay before shipment.
- During checkout, the system should automatically determine whether Pay on Delivery is available based on the selected city.

Order Status

- Pending
- Confirmed
- Packed
- Shipped
- Out for Delivery
- Delivered
- Cancelled

Requirements

- Mobile-first responsive design.
- Clean and modern UI similar to Jumia.
- Well-organized folder structure.
- Secure backend with validation and error handling.
- REST API following best practices.
- Proper database relationships.
- Reusable React components.
- Clean, commented code.
- Production-ready architecture.

Do not generate the entire project at once.

Instead, build it step by step.

Start by: 1. Designing the complete system architecture. 2. Creating the database schema. 3. Designing the folder structure. 4. Listing all API endpoints. 5. Creating the UI wireframes. 6. Then begin implementing each feature one by one.

After each step, wait for my approval before continuing.
